

# Solidity 安全

# 安全的重要性

- 合约不可修改 + 直接处理资金
- 每年因安全问题，导致数十亿的美元的资金损失
- 让区块链安全比 Web2 安全成为一个更突出的问题

# 常见安全问题

# 常见漏洞

- 重入攻击
- Dos 拒绝服务
- 签名重用
- 溢出 ( $Solidity < 0.8$ ) 、 精度损失
- 合约账户控制

# 找问题

```
function withdraw() public {
    (bool success, ) = msg.sender.call{value: deposits[msg.sender]}("");
    deposits[msg.sender] = 0;

    require(success, "Failed to send Ether");
}
```

# 重入攻击

- 调用外部函数时，要时刻注意重入问题：
  - 常见的有：带 hook 的转账：ERC777、ERC3613

- 重入

testReplay.sol

# 防范重入攻击问题

- 先检查 - 再修改 - 最后交互 (checks-effect-interaction)
- 重入锁控制

testReplay.sol

# 瞬时存储

- 2024/03 引入的新操作码，引入了一个新存储空间（瞬时存储），读写更便宜
- 对该存储的修改仅在一个交易内有效

```
bool transient locked;

modifier nonReentrant {
    require(!locked, "Reentrancy attempt");
    locked = true;
    _;
    // 函数退出后，可以再次调用它，即使是在同一交易中。
    locked = false;
}
```

# 找问题

```
function enter() public {
    // Check for duplicate entrants
    for (uint256 i; i < entrants.length; i++) {
        if (entrants[i] == msg.sender) {
            revert("You've already entered!");
        }
    }
    entrants.push(msg.sender);
}
```

# 找问题

没有 receive  
fallback

```
uint256 public totalDeposits;
mapping(address => uint256) public deposits;

function deposit() external payable {
    deposits[msg.sender] += msg.value;
    totalDeposits += msg.value;
}

function withdraw() external {
    assert(address(this).balance == totalDeposits);

    uint256 amount = deposits[msg.sender];
    totalDeposits -= amount;
    deposits[msg.sender] = 0;

    payable(msg.sender).transfer(amount);
}
```

# 找问题

- selfdestruct(recipient )
- 验证者 fee\_recipient

<https://prysm.offchainlabs.com/docs/configure-prysm/fee-recipient/>

# 找问题

```
bytes32 public constant TYPEHASH = keccak256("withdrawBySig(uint256 amount)");  
  
function withdrawBySig(uint8 v, bytes32 r, bytes32 s, uint256 amount) external payable {  
    bytes32 structHash = keccak256(abi.encode(TYPEHASH, amount));  
    bytes32 hash = _hashTypedDataV4(structHash);  
    address signer = ECDSA.recover(hash, v, r, s);  
    require(inWhitelist[signer], "error signer");  
    _withdraw(signer, amount);  
}  
  
function _withdraw(address user, uint256 amount) internal {  
    uint256 currentBalance = balances[user];  
    if (currentBalance < amount) {  
        revert SignatureReplay_InsufficientBalance(currentBalance, amount);  
    }  
    balances[user] = currentBalance - amount;  
    payable(msg.sender).transfer(amount);  
}
```

# 找问题

```
uint256 public moneyToSplitUp = 225;
uint256 public users = 4;
uint count;

function shareMoney() public view returns (uint256) {
    return moneyToSplitUp / users;
}

function decrement() public {
    unchecked {
        count--;
    }
}
```

# 找问题

```
function isContract(address account) public view returns (bool) {  
    uint size;  
    assembly {  
        size := extcodesize(account)  
    }  
    return size > 0;  
}  
  
// 确保仅有 EOA 能调用  
function protected() external {  
    require(!isContract(msg.sender), "no contract allowed");  
    .....  
}
```
